

Qualifications

West Wind Aviation Aerocentre - Regina

- Planning Studies
- Design
- Construction Documentation
- Construction Administration

Our firm was retained to undertake a comprehensive aviation centre development project for West Wind Aviation. Starting with a planning study, our firm worked to identify and understand the facility and program requirements in order to develop an integrated planning, design and delivery process for construction of the new aviation facility 'from the ground up'. The final facility integrates passenger services, executive services, pilot services, aircraft maintenance facilities and staff, and offices for the management of the operation.

With the completed and approved planning in place, our firm proceeded to develop the design, carefully integrating hanger, maintenance, office and passenger areas. Care was taken to consider the flow of personnel, staff and the public to ensure safe and efficient operation of the facility. Opportunities were identified for integration and efficiency of building systems. The resulting facility integrates functionality and quality into a facility that is a marquee building for West Wind and aviation in Saskatchewan
